

PROJECT SUMMARY

Structural renovation, re-roof and seismic upgrade of an existing 64,000 square foot tilt-up building for a fully-functional corporate campus. The project required a complete overhaul of a former auto repair shop and the ability to showcase Pentair's proprietary technology as a design element, while providing an architecturally stunning facility with high-end flooring, decorative tilework and modern light fixtures throughout. This Cal Green building houses manufacturing equipment, testing labs and open office space complete with a café, training room, boardroom and modern lobby. Related sitework and parking areas connect the new building with another building on the property. Installation of a 600-ton cooling tower with all associated valves, pumps and equipment was included as well.
